Understanding Depression and the Effects in Our Classrooms

Professor Puppet explains depression to elementary school students.

Therapist Aid explains depression as a mental illness with symptoms appropriate for secondary students.

3.4%

of children aged three to 17 have been diagnosed with clinical depression.

6%

of children aged 12 to 17 have been diagnosed with clinical depression.

37%

of students with a mental health condition age 14 and older drop out of school.

70%

of students in state and local juvenile justice systems have a mental illness

(NAMI, 2019)

Strategies to Use to Help Relieve Depression in the Classroom

- Get to know your students individually early in the year; build relationships
- Be consistent with your communication, reporting both strengths and difficulties
- Remind the student of his or her strengths using genuine, descriptive praise (ex: "Thank you Remy for bringing your pencil to class today" or "I appreciate the time you took on completing your assignment, Colette")
- Encourage the student to concentrate on what will happen today rather than looking way down the road when the anticipation may scare or discourage them
- Rephrase your students' extreme language (ex: "I'm stupid" to "I made a mistake" or "They all hate me" to "some of my peers are not my friend")
- Continue to encourage their involvement in positive activities, even if it is attendance (not necessarily participation)
- Model positive self-talk (ex: I have the power to change my mind, I am capable and
- strong, I can get through this, and I will give it my all to make this work)
- Ask "what happened to you" instead of "what is wrong with you"
- Avoid negative words, punishments, sarcasm, disparagement, or other negative techniques that will only reinforce feelings of incompetence and low self-esteem
- Refer student to the School Counselor, School Psychologist, or School Social Worker for further assistance (ex: referral for counseling services, behavior plan, safety plan, etc.) (NASP, 2019)

Possible Effects of Traumatic Brain Injury (TBI)

Anxiety	Depression		
Increased temper	Changes in social skills		
Flat or restricted affect	Personality changes		
Impulsivity	Mood Swings
